Can a fire department lock out a photovoltaic system?

The fire department must work with the facility personnel or residents to turn off and disconnect any equipment from its energy source before working around it. Here are the lock-out steps for a structure with a photovoltaic system and what to watch for.

Are photovoltaic panels a fire hazard?

Consider the weight of the photovoltaic array on an already weakening roof structure. Because of that additional weight, firefighters may not be able to address the fire from the roof. Also, roof vents, solar thermal panels, and photovoltaic arrays pose a trip hazard for firefighters conducting roof operations.

Why is a photovoltaic system dangerous?

During a fire or an explosion, the frame of a photovoltaic system can quickly degrade, exposing hazardous chemicals to direct flame and become dissipated in the smoke plume. This can cause inhalation hazards to the firefighters and surrounding people, animals, and the environment.

What is the maximum voltage a photovoltaic module can run?

Commercial and industrial buildings are permitted a maximum voltage of 1,000 volts DC. For a photovoltaic module, the maximum system voltage is calculated and corrected for the lowest-expected ambient temperature.

Remember to share copies of your emergency plan with local fire departments and keep one in an easily accessible location on-site. Consider ...

Combines high-voltage lithium battery packs, BMS, fire protection, power distribution, and cooling into a single, modular outdoor cabinet. Uses LiFePO<sub>4</sub> batteries with high thermal stability, extensive cycle ...

NFPA is keeping pace with the surge in energy storage and solar technology by undertaking initiatives including training, standards development, and research so that various ...
