By quantifying the relationship between control strategies and profitability, the study provides actionable insights for renewable energy operators and policy makers.

This paper considers the complementary capacity planning of a wind-solar-thermal-storage hybrid power generation system under the coupling of electricity and carbon cost markets.

By quantifying the relationship between control strategies and profitability, the study provides actionable insights for renewable energy ...

Although the plant design is sensitive to model parameters and various other assumptions, our results demonstrate some of the optimal designs that occur in different scenarios and what one ...

Microgrids will be an essential component of the new-type power system. This study investigates the capacity configuration optimization of park-level wind-solar-storage microgrids, ...

Establishing a model to optimize energy storage capacity based on these indicators. The model is utilized to identify the optimal energy storage capacity setup for maximizing net profit.

To make full use of the electric power system based on energy storage in a wind-solar microgrid, it is necessary to optimize the configuration of energy storage to ensure the stability of a ...

Taking a microgrid in South China as an application scenario, the model is solved and the optimal capacity allocation scheme of the microgrid is ...
